ABSTRACT

This software engineering competency model (SWECOM) describes competencies for software engineers who participate in developing and modifying software-intensive systems. Skill areas, skills within skill areas, and work activities for each skill are specified. Activities are specified at five levels of increasing competency. Case studies of how the SWECOM model can be used by a manager, an employee, a new hire, or a curriculum designer are provided. The SWECOM-Staffing Gap Analysis and Individual Gap Analysis worksheets are included in an appendix.

1. INTRODUCTION

A competent person has the skills needed to perform, at a given level of competency, the work activities assigned to him or her. Knowledge, in this competency model, is different from *skill*: knowledge is what one knows, while skill is what one can do. This document presents a competency model for use by those who develop software, their managers, human-resource personnel, curriculum designers, and others listed in Appendix B of this document. An individual who develops or maintains software might use this competency model to assess his or her current competency levels for various software engineering activities or to develop a plan for improving his or her competencies (such as requirements elicitation, design synthesis, software construction, test planning). A manager (project, functional, or line) might use this competency model to inventory staff skills and identify areas for needed additions and improvements. Additionally, a manager might use this model to counsel individual employees, or HR personnel might use the model to identify needed training and recruitment activities. Each activity in this competency model is described at five levels of competency.

Skill areas in this competency model include skills that are decomposed into activities, rather than job roles, because job roles are typically dependent on the organizational environment in which the work activities occur. The activities in this model can be grouped into job roles by organizations, organizational units, or projects to satisfy their needs.

This competency model is termed the Software Engineering Competency Model (SWECOM). It has been validated by invited subject matter and interested public reviewers. Subsequent revisions have been made in response to those reviews. SWECOM contributors are listed in Appendix A.

Appendix B lists the intended audience for SWECOM. Appendix C includes use cases to indicate how managers, employees, and new hires might find SWECOM useful. Appendix D includes gap analysis worksheets for use by individual practitioners and those who do staffing for projects and organizational units. A Glossary of Terms provides definitions of terms whose meanings, as used in SWECOM, may differ from conventional meanings.

SWECOM includes skill areas, skills, and activities for individuals who develop and maintain software (that is, software engineers and others). SWECOM is based on the following primary references:

- SWEBOK Guide Version 3 (Guide to the Software Engineering Body of Knowledge),
- ISO/IEEE Standard 12207 (software engineering processes),
- Elements of ISO/IEEE Standard 15288 (systems engineering processes) applicable to the development of software-intensive systems,
- Relevant material in SEBoK (Systems Engineering Body of Knowledge) and GRCSE (Graduate Reference Curriculum for Systems Engineering),
- The Software Assurance Competency Model,
- GswE2009 (graduate software engineering curriculum guidelines), and
- SE2004 (undergraduate software engineering curriculum guidelines).

The references section of this document provides citations for these foundational documents.

This competency model adds to the growing body of knowledge that characterizes the software engineering profession and software engineering professionals. It is based on, and supplements, the information found in the primary references and in the extensive list of references found in that section. SWECOM is presented as a framework that can be tailored to fit the needs of organizations, programs, and projects. It is not a prescriptive model of the software engineering profession or a characterization of a software engineering professional. Various organizations, agencies, and other institutions may choose to adopt and enforce particular elements of the model to fit their needs and extend SWECOM in various ways.

SWECOM covers technical skills but does not include project management or general management skills other than to identify the behavioral attributes and skills of effective software developers and the leadership skills needed for software project technical leaders of various skill areas. The *PMBOK*® *Guide—Fifth Edition* [PMBOK 2013], the *Software Extension to the PMBOK*® *Guide—Fifth Edition* [SWX 2013], and many other references address project management and general management. Also, SWECOM does not recommend specific software tools or development methods (such as waterfall, Scrum, XP).

2. SWECOM AND THE US IT COMPETENCY MODEL

SWECOM includes elements similar to those in the US Department of Labor Information Technology (US IT) Competency Model, which was developed to identify the knowledge, skills, and abilities needed for workers to perform successfully in the field of information technology [INFOCOMP 2012].¹

Table 1 indicates the correspondences between the US IT Competency Model and the analogous elements of SWECOM.

^{1 &}quot;Information technology" is broadly interpreted in the US IT competency model.

Model and SWECOM			
US IT Competency Model	SWECOM		
Personal Effectiveness	Behavioral Attributes and Skills		
Academic Competencies	Requisite Knowledge for SWECOM Technical Skills		
Workplace Competencies	Cognitive Skills		
Industry-Wide Technical Competencies	SWECOM Technical Skills		
Industry-Sector Technical Competencies	Possible extensions to SWECOM for software applications, embedded software, and domain-specific competencies (for example, health sciences, communication, automotive domains)		
Management Competencies	Skills related to scheduling, budgeting, and resource management are excluded from SWECOM		
Occupation-Specific Requirements	Excluded from SWECOM		

Table 1. Correspondences between the US IT CompetencyModel and SWECOM

As indicated in Table 1, knowledge, behavioral attributes and skills, and cognitive skills in SWECOM are the counterparts of personal effectiveness, academic competencies, and workplace competencies in the US IT Competency Model. Technical skills are the primary focus of SWECOM and are the counterpart of industry-wide technical competencies. The other elements of SWECOM are included to support the technical competencies. Industry-sector competencies for various sectors of the software engineering industry represent extensions that could be added to SWECOM. Management competencies other than leadership skills related to leading technical contributors are not included because management includes a distinct, though related, set of competencies that are covered in the PMI Guide to the Project Management Body of Knowledge (PMBOK®) Guide) [PMBOK 2013], the Software Extension to the PMBOK® Guide [SWX 2013], and other similar documents. Occupation-specific requirements include factors such as certifications and licensing requirements needed to pursue specific occupations; they are not included in SWECOM.

3. THE ELEMENTS OF SWECOM

The elements of SWECOM are illustrated in Figure 1. Cognitive skills and behavioral attributes and skills are described below. These foundations are not unique to SWECOM but were developed for SWECOM as necessary for the effective performance of software engineering technical activities. Requisite knowledge is the intellectual basis for the software engineering profession. The references listed above, those cited in the references section, and those in the consolidated reference list in the *SWEBOK Guide* (www.swebok. org, Appendix C) characterize requisite knowledge.

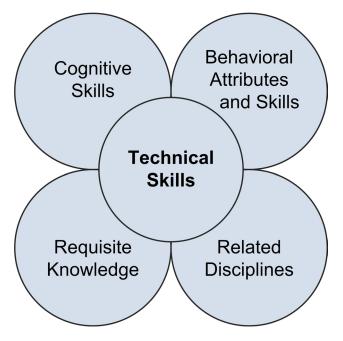

Figure 1. The Elements of SWECOM

Related disciplines include but are not limited to:

- Computer Engineering,
- Computer Science,
- General Management,
- Mathematics,
- Project Management,

- Quality Management, and
- Systems Engineering.

There are many related disciplines; these listed are *closely* related disciplines, as cited in [SWEBOK 2014].

Cognitive skills apply across all the skill areas, skills, and activities of SWECOM. They are exhibited in the ability to apply knowledge and reasoning while performing SWECOM activities within technical skill areas. Competency levels for cognitive skills are not included in SWECOM, but cognitive skills become increasingly important at higher levels of technical competency because the scope and complexity of work activities increases and expands as the levels of competency and related job assignments increase. Some examples of cognitive skills are listed and briefly described in Table 2.

As shown in Table 2, the SWECOM cognitive skills include four classifications. It should be emphasized that these classifications are not independent: the skills listed across classifications overlap and combine to support effective cognitive competencies. Furthermore, the list in Table 2 is intended to be illustrative—not exhaustive—of cognitive skills for software engineers. Citations that provide the basis for and details of these cognitive skills are listed in the references section of this document.

Table 2. SWECOM Cognitive Skills			
Cognitive Skills	Examples		
Reasoning provides the basis for making decisions in a logical and effective manner.	Inductive Reasoning Deductive Reasoning Heuristic Reasoning Use of Abstraction Hierarchical and Associative Reasoning		
Analytical skills are related to techniques that involve data collection, organization and aggregation of data, and analysis and evaluation in order to draw conclusions or make decisions.	Application of Measurement Principles Statistical/Data Analysis Root Cause Analysis Risk Identification and Analysis Impact Analysis		

Table 2. SWECOM Cognitive Skills			
Cognitive Skills	Examples		
Problem solving is concerned with various methods that employ reasoning, analytic techniques, and prioritizing information to solve problems.	Divide and Conquer Stepwise Refinement Top-down Approach Bottom-up Approach Analogy and Reuse Patterns and Pattern Recognition Iterative and Incremental Approaches		
Innovation involves skills used to create models and abstractions that support analysis and problem solving.	Brainstorming Prototype Development Modeling and Simulation		

Behavioral attributes and skills are exhibited in the ability to productively apply knowledge, cognitive skills, and technical skills; they are not unique to software engineering but allow software engineers to effectively contribute to desired outcomes. Some important behavioral attributes and skills for software engineers are listed in Table 3; other behavioral attributes and skills could be added.

Table 3. SWECOM Behavioral Attributes and Skills			
Aptitude	Exhibited by the ability to effectively perform a software engineering task. Aptitude is not the same as knowledge or skill but rather indicates the ability (either intuitive or learned) to apply knowledge in a skillful way.		
Initiative	Exhibited by enthusiastically starting and following through on a software engineering work task.		
Enthusiasm	Exhibited by expressing and communicating interest in performing a work task.		
Work ethic	Exhibited by being reliable, acquiring new skills, and being willing to perform work tasks.		
Willingness	Exhibited by undertaking a task when asked and capably performing it, even if it is a task the individual is not enthusiastic about performing.		
Trustworthiness	Demonstrated over time by exhibiting ethical behavior, honesty, integrity, and dependability in an individual's decisions and actions.		

Table 3. SWECOM Behavioral Attributes and Skills			
Cultural sensitivity	Exhibited by an awareness of and accommodation for differences in communication styles, social interactions, dress codes, and overall behavior based on ethnic, religious, gender orientation, and other behavioral characteristics.		
Communication skills	Exhibited by expressing concepts, techniques, thoughts, and ideas in both oral and written forms in a clear and concise manner while interacting with team members, managers, project stakeholders, and others; includes effective listening.		
Team participation skills	Exhibited by working enthusiastically and willingly with other team members while collaborating on shared tasks.		
Technical leadership skills	Exhibited by effectively communicating a vision, strategy, method, or technique that is then accepted and shared by team members, managers, project stakeholders, and others.		

Behavioral attributes and skills apply to all elements and at all levels of technical skill areas, skills, and activities. Behavioral attributes and skills and cognitive skills are not specified by competency level; however, increasing competency in cognitive skills and behavioral attributes and skills becomes more important as the levels of technical competencies, the scope of responsibilities, and the breadth of interactions increase.

4. SWECOM TECHNICAL SKILLS

Technical skills and associated activities are the primary focus of SWECOM; they are grouped as life cycle skill areas and crosscutting skill areas. A life cycle skill area is one that includes skills needed to accomplish various work activities within a phase of software development or sustainment—for example, software requirements engineering. Life cycle skill areas are categorized by typical phases of software development and modification. In practice, software phases are often intermixed, interleaved, and iterated in various ways; however, no implication of development processes (for example, predictive versus adaptive) is intended.

A crosscutting skill area is one that applies across all life cycle skill areas (for example, quality assurance) and, in some cases, a crosscutting skill may apply to other crosscutting skill areas (for example, a software process model). Crosscutting skill areas are sometimes called "specialty disciplines" that are practiced by specialists in those skill areas (such as safety, security, systems engineering). Software engineers who are competent in one or more life cycle skill areas typically have some working knowledge of crosscutting skill areas.

The five life cycle skill areas and eight crosscutting skill areas of SWECOM are listed in Tables 4 and 5, respectively. The references cited in the tables are in the references section of this document; they provide the knowledge foundations for each skill area.

The activities for each skill in Tables 4 and 5 are listed in each skill area's Tables A and B; see below. Table A lists the activities for each skill and Table B lists activities by competency level. SWECOM does not address competency in using tools or adherence to prescribed standards to accomplish activities because these will be specific to organizations and projects.

5. SWECOM COMPETENCY LEVELS

SWECOM is organized by skill area (for example, software requirements), skills within skill areas (for example, software requirements elicitation), and activities within skills (for example, prototyping to elicit requirements). Activities are specified at five levels of competency:

- Technician
- Entry Level Practitioner
- Practitioner
- Technical Leader
- Senior Software Engineer

In general, a Technician follows instructions, an Entry Level Practitioner assists in performance of an activity or performs an activity with supervision; a Practitioner performs activities with little or no supervision; a Technical Leader leads individuals and teams in the performance of activities; and a Senior Software Engineer modifies existing methods and tools and creates new ones. Some organizations may choose to merge the Technician and Entry Level Practitioner levels. A Senior Software Engineer may serve as a "chief engineer" for a software organization and some Senior Software Engineers may be recognized as industry experts who contribute to shaping and advancing the profession of software engineering.

In addition to the activities specified at the various competency levels, an additional competency of all software engineers is to instruct and mentor others, as appropriate, in the methods, tools, and techniques used to accomplish those activities. For example, a Technician or Entry Level Practitioner might instruct or mentor others on the use of configuration management tools as needed to perform their activities, or a Team Leader might instruct or mentor a Practitioner on how to lead inspections and reviews.

The following notations are also used in SWECOM:

- Follows (F),
- Assists (A),

- Participates (P),
- Leads (L), and
- Creates (C).

For the requirements prototyping activity cited above, a Technician would be competent to use software tools while following instructions (F) to create prototypes. An Entry Level Practitioner would be competent to assist in creating prototypes and to develop prototypes under supervision (A); a Practitioner would create prototypes and interact with customers and users in evaluating the prototypes (P); a Technical Leader would supervise and lead prototyping activities (L); and a Senior Software Engineer would create new approaches to prototyping (C).

There may be situations where an Entry Level Practitioner might be competent, for example, to lead a prototyping activity, or a Technical Leader might be competent to create a new approach to prototyping, so notations are used in SWECOM to distinguish specific competencies from the named competency levels when it is appropriate.

A Practitioner, for example, might be competent to either participate in an activity (P) or lead the activity (L), depending on the scope and complexity of the work to be accomplished. In this case, the activity is labeled (P/L) at the Practitioner level. Similarly, an Entry Level Practitioner might be competent to assist or fully participate in an activity, which would be labeled (A/P).

SWECOM does not prescribe the knowledge level or years of experience associated with these competency levels; however, the following general guidelines are typical:

An individual who is competent at the Technician level to perform the activities in one or more skills or skill areas might have some advanced education (for example, a two-year US associate's degree or equivalent), one or more industrial certifications, and any number of years of experience.

An individual who is competent as an Entry Level Practitioner to perform the activities in one or more skills or skill areas would probably have requisite knowledge equivalent² to that provided by an

² Knowledge equivalence might be gained by a combination of education, mentoring, training, and on-the-job experience.

ABET-accredited software engineering degree program or equivalent and zero to four or five years of relevant experience.³

An individual who is competent at the Practitioner level to perform the activities in one or more skills or skill areas would probably have knowledge equivalent to or greater than that of an Entry Level Practitioner, might have a master's degree in software engineering or a related discipline, and would probably have more than five years of experience in the relevant skill areas.

An individual who is competent as a Technical Leader for one or more SWECOM activities, skills, or skill areas would likely have relevant knowledge and experience equal to or greater than that of a Practitioner plus the behavioral attributes and skills needed to be an effective technical leader.

A Senior Software Engineer is an individual who is competent to develop policies, procedures, and guidelines for the technical processes and work products within an organizational unit that is engaged in software engineering.

These characterizations of education and experience are examples and not to be interpreted as prescriptive requirements.

Some activities may not have corresponding lower level activities. For example, conducting an impact analysis to determine the effect of modifying or adding requirements for product security or performance might be a Practitioner skill and not an activity that a person at a lower level of competency would be competent to perform.

An individual may be at different levels of competency for different skill areas, skills within skill areas, and activities within skills, depending on his or her educational background, work experiences, and aptitude. The SWECOM activities, skills, and skill areas are presented as a framework that can be tailored to fit the needs of individual organizations, programs, and projects. Some organizations may choose to use SWECOM in a prescriptive manner by requiring software engineers who are competent in a skill area at a given competency level to be competent in all of the skills and activities in that skill area at that level and at all lower levels. Other organizations, programs, and projects may use SWECOM to pick and

³ Relevant experience is the experience needed to acquire ability, at a given level of competency, for a SWECOM skill area, skill, or activity.

choose skill areas, skills, and activities needed for particular missions, programs, or projects without regard to other competencies and competency levels.

An example of activities competency levels from the requirements management skill within the software requirements skill area illustrates the approach taken in subsequent sections of this competency model; see Table 6. In general, these notations correspond to the five levels of competency. In some cases, an individual at a lower level of skill competency may be competent to perform some activities—but not all—at a higher level. For example, an Entry Level Practitioner may be competent to perform traceability analysis (P), or a Practitioner may be competent to lead certain activities (L).

Table 6. Competency Levels for Software RequirementsManagement Work Activities					
Skill Area:	Software Re	quirements			
Skill: Requi	irements Ma	nagement			
Competency Levels	Technician	Entry Level Practitioner	Practitioner	Team Leader	Senior Software Engineer
Activities	1. Follows defined procedures to support require- ments manage- ment (F)	1. Assists require- ments manage- ment through the use of appropriate tools (A)	1. Imple- ments require- ments manage- ment plans for projects (P/L)	1. Prepares require- ments manage- ment plans for projects (L)	1. Modifies existing and cre- ates new guidelines, templates, tools, and techniques for require- ments manage- ment (C)

Note that in some cases (such as for the Practitioner level in Table 6) an individual may be competent to either participate in or lead a work activity such as implementing a requirements management plan. Whether that individual is competent to participate or lead may depend on the size, scope, and complexity of the project and product; in such cases, the notation is (P/L).

6. EMPLOYER AND INDIVIDUAL GAP ANALYSIS

Appendix D includes two worksheets similar to those in the US IT Competency Model [INFOCOMP 2012]. The first spreadsheet (SWE-COM Staffing Gap Analysis Worksheet) is for use by managers, human resources personnel, and others who analyze available and needed skills within an organizational unit.

The second spreadsheet (SWECOM Individual Gap Analysis) is for use by an individual who desires to assess his or her levels of competency for different skills and activities at different competency levels. An individual can use the spreadsheet for self-assessment or an individual and manager can use it as a basis for developing a plan of improvement for the individual; the improvement plan might include future work assignments, mentoring, and/or additional education and training.

7. SWECOM VALIDATION

SWECOM has been validated by 22 subject matter reviewers and 40 public reviewers.

Many narrative review comments were received from both subject matter reviewers (SMEs) and public reviewers. The SWECOM author team adjudicated all comments and informed reviewers of their decisions.

Members of the SWECOM team interviewed six software engineering professionals. The purpose of the interviews was to determine the value of a software engineering competency model and the relevancy and usefulness of various SWECOM elements (for example, cognitive attributes, behavioral attributes and skills, skill areas, competency levels, and so forth). These interviews also allowed the SWECOM developers to conduct a "sanity check" on SWECOM before releasing a draft for external review. The interview results can be summarized as follows:

- All those interviewed had degrees in computing-related disciplines and 12 to 29 years of experience in the software industry, and were serving in mid- to high-level positions in their organizations (for example, system architect, quality assurance director, software development manager, technical support manager, software development director).
- There was unanimous agreement that SWECOM will provide valuable support for recruiting, evaluating, developing, and advancing software engineering professionals.
- Most interviewees voiced the opinion that nontechnical competencies were essential to the success of a software engineering professional: good people skills, flexibility, and the ability to communicate, work in teams, work with customers, learn new things, and work with people from different cultures. As a result of the last observation, the SWECOM developers added a behavioral attribute of "Cultural Sensitivity."
- Most of those interviewed thought five or six levels of competency were appropriate. However, none of those interviewed who have used other competency models have ever before used the Technician Level or equivalent.
- Some interviewees expressed the view that no degree or minimum years of experience should be specified for the competency levels. SWECOM only describes "typical" backgrounds, and no requirements or precise expectations are stated.
- There were no recommendations for major changes to SWECOM.

These six interviews did not provide a statistically significant sample of opinions but they did indicate that the SWECOM effort is well conceived. The SME and public review comments provided many valuable recommendations, but none invalidated the SWE-COM concept.

The following sections of this document specify life cycle and crosscutting skill areas plus skills and activities at various competency levels within each skill area. Each skill area includes two tables: Table A lists skills and corresponding activities for that skill area, and Table B lists the activities across all five competency levels.

8. ACKNOWLEDGEMENTS

Appendix A lists individuals who developed this competency model, the subject matter expert reviewers, the public reviewers, and those who were interviewed.

10. GLOSSARY OF TERMS

This glossary provides definitions of terms whose meanings, as used in SWECOM, may differ from conventional meanings. Other terms used in SWECOM are intended to convey the meanings in IEEE/ ISO/IEC Standard 24765:2010, *Systems and Software Engineering*—*Vocabulary*, IEEE, 2010 (SEVOCAB). The *Guide to the Software Engineering Body of Knowledge* [SWEBOK 2014] also provides detailed discussions of many of the terms used in SWECOM.

Terms italicized in the definitions of other terms are also defined in this glossary.

- **Activity:** a self-contained unit of work to be performed. Activities are the smallest units of technical skills in SWECOM.
- **Behavioral Attribute:** a characteristic of personality and character that enables an individual to apply knowledge, experience, and *cognitive attributes* to perform *activities* in a productive manner within the work environment.
- **Cognitive Skill:** a characteristic of intellect that allows an individual to apply knowledge and reasoning ability while performing *activities* within technical *skill areas*.
- **Competency:** the demonstrated ability to perform work *activities* at a stated *competency level*.
- **Competency Level:** one of five increasing levels of ability to perform an *activity*; denoted as *Technician, Entry Level Practitioner, Practitioner, Technical Leader,* or *Senior Software Engineer*.
- **Entry Level Practitioner:** an individual who is competent to assist in performing an *activity* or to perform activities with some supervision.

- **Gap Analysis:** the process of specifying the competencies an individual or organization has, the competencies needed, and gaps between what is had and what is needed.
- Senior Software Engineer: an individual who is competent to create new—and modify existing—processes, procedures, methods, and tools for performing *activities*, groups of *activities* within *skills*, and *skills* within *skill areas*.
- **Practitioner:** an individual who is competent to perform an *activ-ity* with little or no supervision.
- **Skill:** a grouping of logically related *activities*.
- **Skill Area:** a grouping of logically related *skills*.
- **Technical Leader:** an individual who is competent to lead and direct participants in the performance of *activities* in a *skill* or *skill area*.
- **Technician:** an individual who is competent to follow instructions while performing an *activity*.
- **Usability Test:** a test case that states what the user needs to do but does not tell the user how to do it. It measures the user interface's ability to support user behavior.

11. SOFTWARE REQUIREMENTS SKILL AREA

Software requirements engineering consists of activities performed to discover what functional and nonfunctional attributes and interfaces a software system should have to satisfy the needs of the customer. It also includes analysis and management activities performed in order to discover flaws in requirements artifacts and to manage the requirements engineering process.

(L)	1. Selects the most appropriate formal and informal require- ments vali- dation and verification techniques. (L)	1. Creates new require- ments vali- dation and verification techniques. (C)		
ments Verif	2. Assists in prototype construction and testing. (F/A)		2. Creates prototypes of different types as needed. (P)				
Software Require			3. Assists in negotiat- ing conflicts between stake- holders in require- ments veri- fication. (A)	2. Negotiates conflicts between stake- holders in require- ments verification. (P/L)			
Software Requirements Process Management	1. Follows and applies defined processes for require- ments engineering with guid- ance. (F/A)	1. Assists in apply- ing defined processes for require- ments engi- neering. (A)	1. Performs tradeoff analysis of require- ments activities. (P/L)		1. Sets strategy and direc- tion for the require- ments pro- cess across projects and func- tional units of an orga- nization. (L)		

12. SOFTWARE DESIGN SKILL AREA

Software design skills are used to develop and describe the software architecture of a system based on its software requirements: this consists of a description of how software is decomposed into components and the interfaces between those components. The components are specified at a level of detail that enables their construction. This skill area also includes skills related to processes and techniques for software design quality, analysis, and evaluation.

Table A12	Table A12				
Software Design Skill Sets	Software Design Activities				
Software Design Fundamentals	 Employ enabling techniques (such as abstraction, coupling/cohesion, information hiding, and so forth) in software design. Apply exception handling and fault tolerance techniques in software design. Use restructuring and refactoring methods in software design. Apply, as appropriate, design techniques in the areas of concurrency, event handling, data persistence, or distributed software. 				
Software Design Strategies and Methods	 Determine the process and strategy to be used in software design (such as top-down or bottom-up, stepwise refinement, use of patterns and pattern languages, iterative and incremental processes, and so forth). Select and apply the appropriate design methodology (such as a structural or object-oriented approach). Consider design alternatives and perform trade-off analysis. Manage software design activities. 				
Software Architectural Design	 Use architectural styles, views, models, and patterns to specify the high-level organization of a software system. Specify the component interfaces. Design software components and modules using models, design patterns, notations, and diagramming techniques. 				
Software Design Quality Analysis and Evaluation	 Utilize software design reviews. Perform static analysis tasks to evaluate design quality. Develop and use simulation and prototypes to evaluate software design quality. Manage requirements change. 				

The following notations are used in Table B12: Follow (F), Assist (A), Perform (P), Lead (L), Create (C).

ware Design Quality Analysis and Evaluation				2. Uses the results of software design quality evaluation activities to assess the qual- ity of the design and to decide on correc- tive action, if needed. (P/L)	2. Creates new tech- niques for evaluating software design qual- ity. (M)			
Software				3. Provides guidance and direc- tion related to the need for require- ments change resulting from design review. (P/L)				

13. SOFTWARE CONSTRUCTION SKILL AREA

Software construction is the collection of activities and processes for converting design specifications into functional software solutions that meet customer needs. It includes planning, designing, programming, debugging, testing, and integrating software components. Most software construction is performed by teams of professionals using tools (editors, compilers, version control software, debuggers, and so forth) and processes to accomplish and coordinate their work.

Table A13	
Software Construction Skill Sets	Software Construction Activities
Software Construction Planning	 Select appropriate processes and models for constructing software, including appropriate reuse processes. Select appropriate languages and tools for software construction. Select appropriate frameworks, platforms, and environments.
Managing Software Construction	 Establish and follow project standards for version control and configuration management. Collect and monitor standard measures of code quality and size.
Detailed Design and Coding	 Create detailed designs that minimize complexity and enhance quality. Create code to implement detailed designs. Refactor code when needed. Establish and follow standards for designs and code. Use appropriate design patterns. Use defensive coding techniques to minimize propagation of errors and threats. Document code through comments to support software maintenance. Generate code from design models.
Debugging and Testing	 Use appropriate tools and techniques for debugging. Create and execute unit tests for all delivered code. Achieve test coverage goals.
Integrating and Collaborating	 Establish and follow integration strategy and processes. Perform integration testing as part of the integration process. Collaborate with other team members in development activities (such as pair programming, informal reviews). Participate or lead reviews and inspections.

The following notations are used in Table B13: Follow (F), Assist (A), Perform (P), Lead (L), Create (C).

Table B13							
Software Construction Skill Sets and Activities by Competency Level							
			Levels	1	I		
Skill Sets	Technician	Entry Level	Practitioner	Technical Leader	Senior Software Engineer		
Software Construction Planning			1. Assists in the selec- tion of appropriate processes and models for software construc- tion. (F/P)	1. Selects appropriate processes and models for con- structing software on individual projects (such as compilation, genera- tion from domain- specific languages). (L)	1. Creates or proposes new pro- cesses and models for software construc- tion. (C)		
Softwar			2. Assists in the selec- tion of appropriate languages and tools for software construc- tion. (F/P)		2. Creates new lan- guages and tools for software construc- tion. (C)

		4. Participates in project- defined reviews and inspections. (P)			4. Creates new code review and inspection methods. (C)			
Integ	4. Sets up build-and- install envi- ronments where the software packages can be inte- grated. (P)							

14. SOFTWARE TESTING SKILL AREA

Software testing is a component of overall software quality; however, the software quality skill area in SWEBOK is a crosscutting skill area, whereas the software testing skill area is a life cycle skill area. Software testing includes all activities that are performed to evaluate overall product quality, which requires code execution. This software testing skill area covers "dynamic verification" and is concerned with selecting an appropriate set of test cases that demonstrate the expected behavior of the product by executing the software using prepared test cases and their results to analyze and improve the quality of the product. It is well known that software cannot be tested exhaustively for all possible situations; therefore, "selecting an appropriate set of test cases" has a major effect on the success or failure of testing activities.

Table A14	
Software Testing Skill Sets	Software Testing Activities
Software Test Planning	 Identify all stakeholders involved in software testing. Identify success and failure criteria. Identify test completion criteria. Design and implement the software test plan. Identify and coordinate customer representatives and other stakeholders participating in the software acceptance and/ or demonstration.
Software Testing Infrastructure	 Identify tools to be used throughout testing activities. Identify appropriate documentation to be generated and archived. Design/select and implement the test environment.
Software Testing Techniques	 Identify test objectives. Select appropriate testing/demonstration techniques. Design, implement, and execute test cases.
Software Testing Measurement and Defect Tracking	 Identify, collect, and store appropriate data resulting from testing/demonstration. Report test results to appropriate stakeholders. Identify, assign, and perform necessary corrective actions. Analyze test data for test coverage, test effectiveness, and process improvement.

NOTE: Throughout the industry, a large number of testing techniques have been and are used. Whenever testing techniques are discussed in this skill area, it could potentially refer to any of those techniques; in such cases, "testing" is in *italics*. In a few instances, "testing" refers to a specific technique and is not in italics.

The following notations are used in Table B14: Follow (F), Assist (A), Perform (P), Lead (L), Create (C).

Software T			5. Monitors test prog- ress by evaluat- ing defect arrival rate, failure intensity, and so forth. (P)	5. Monitors overall <i>test</i> progress by evaluat- ing defect arrival rate, failure intensity, and so forth. (L)				

15. SOFTWARE SUSTAINMENT SKILL AREA

As systems become larger, more complex, and increasingly reliant on software, sustainment issues become increasingly complex and time consuming. A study of software systems effort distribution indicated that 55% of software system life cycle effort involves sustainment activities [CMU/SEI-2006-TN-007]. The risks of inadequate sustainment can potentially undermine the stability, enhancement, and longevity of operational systems.

No authoritative definition of "software sustainment" exists. The Software Engineering Institute's working definition is, "The processes, procedures, people, material, and information required to support, maintain, and operate the software aspects of a system" [Lapham 2006].

The IEEE Standard Glossary of Software Engineering Terminology defines software maintenance as "The process of modifying a software system or component after delivery to correct faults, improve performance or other attributes, or adapt to a changed environment" [IEEE/ISO/IEC 24765-2010].

According to these definitions, software sustainment addresses issues of maintenance plus documentation, deployment, operation, security, configuration management, training (users and sustainment personnel), help desks, COTS product management, technology updates, and software retirement.

Three categories of software maintenance activities—corrective, adaptive, and perfective—involve modifying a software product/ system after delivery. A fourth category of software maintenance activities focuses on preventive maintenance.

Successful software sustainment depends on the culture of the sustainment organization, the skills of the sustainment team (which is the focus of this skill area), the flexibility of the customer, and the operational domain of the product, in addition to skills needed to modify source code for corrective, adaptive, and perfective enhancements.

Table A15					
Software Sustainment Skill Sets	Software Sustainment Activities				
Software Transition	 Develops transition plan. Identifies stakeholders for transition and operational requirements. Identifies system and software constraints. Identifies applicable systems and software operational standards (such as information assurance). Develops software transition and operational documentation. Installs software. Performs software operational training (for both users and sustainment personnel). Determines the impacts on the operational environment. Develops software system activation and check-out procedures. Participates in system acceptance. 				
Software Support	 Maintains current software configurations. Performs operational software assurance. Updates COTS and other software technologies to maintain currency. Diagnoses and responds to reported software defects, anomalies, and operational incidents and events. Monitors system operation and collects operational data. Develops and implements software retirement procedures. 				
Software Maintenance	 Establishes software maintenance processes and plans. Obtains and maintains baseline software artifacts. Performs problem identification and technical impact analysis. Makes and assures changes to software (corrective, adaptive, perfective). Performs preventative maintenance and software re-engineering. Monitors and analyzes software maintenance activities.

16. SOFTWARE PROCESS AND LIFE CYCLE SKILL AREA

Software process models and life cycle models skills are concerned with process definition and tailoring, implementation, workflow, assessment, measurement, management, and improvement of the software life cycle processes, including processes both for guiding a specific set of activities and for postmortem. The skills apply to a range of software process paradigms that range from plandriven processes (sometimes called predictive processes) to agile processes (sometimes called adaptive processes) and the spectrum of processes between the two.

A key element of software processes is measurement and assessment of the effectiveness of individual activities and their combinations for software projects. The key purpose of process assessment is to identify process activities and combinations that need to be modified to better achieve project goals.

Software process model and life cycle model skills apply across most of the other skill areas in this document, including both life cycle and crosscutting skill areas.

Table A16	
Software Process and Life Cycle Skill Sets	Software Process and Life Cycle Activities
Software Development Life Cycle Implementation	 Determine one or more organization-wide life cycle models (such as waterfall, spiral, V-model, incremental, maturity models). Select a team software process (plan-driven, adaptive). Lead a small team in execution of some portion of a life cycle process model (such as software design). Carry out process activities specified in a life cycle process model script.
Process Definition and Tailoring	 Define software processes for a project team or for a software engineering activity (such as requirements engineering). Tailor a defined software process to the needs of a project team or software engineering activity. Interpret and adapt a software process to individual process responsibilities and tasks. Lead definition and tailoring of organization- wide software processes.
Process Implementation and Management	 Implement and execute software processes. Provide guidance and advice to software teams on how to implement and manage software processes. Serve as a member of a software engineering process group.
Process Assessment and Improvement	 Collect data for assessment of a software process. Analyze process assessment data and implement improvement of team software processes. Use assessment information and reports for software process improvement.

		3. Assesses and imple- ments improve- ment of an individual software process. (A/P)	3. As a mem- ber of an SEPG, pro- vides input on software process improvement. (A/P)	3. Leads the SEPG in providing guidance on depart- ment- or organiza- tion-wide software process improve- ment. (L/C)	2. Uses assessment data, team reports, and SEPG reports to establish organization procedures and stan- dards for software process improve- ment. (C)		

17. SOFTWARE SYSTEMS ENGINEERING SKILL AREA

Systems are collections of interconnected components that interact with other systems and the environment in which they are embedded. They include natural systems, such as our solar system, and human-made systems, such as digital computers. Modern engineered systems range from household appliances to medical devices, automobiles, spacecraft, and nuclear reactors. Engineered systems are increasingly reliant on software to provide functionality, behavior, interconnections among components, and external interfaces to environments that may be complex and ill defined.

Software engineers are often members, and may be leaders, of teams that develop and modify large and/or complex systems composed of diverse kinds of components, including software. Not all software engineers will be, or need to be, competent software systems engineers; however, those software engineers who participate as members of systems engineering teams for software-intensive systems should have the skills required to participate in systems engineering projects. The skills and activities in this skill area apply to development of systems for which software is a critical component but for which software may not be the primary cost item or the key technology to be exploited.

Not all software-intensive systems are engineered systems in the traditional sense. For example, an enterprise information system (EIS) may be dependent on software but the time, effort, and cost of procuring and installing hardware and infrastructure software may far exceed the time, effort, and cost of developing business-specific

software within the EIS environment. Systems engineering skills will be needed in these cases.

Table A provides a list of skills and work activities for a software engineer to competently participate in as a member of a systems engineering team that develops or modifies a large and/or complex software-intensive system.

Table A does not include all of the skills and activities that are important for a software engineer who participates in systems engineering of software-intensive systems but rather highlights those that are especially important at the systems level. For example, requirements elicitation is not included because the necessary skills are similar at both the systems and software levels. The difference in requirement elicitation, and in many other skill areas, is in the scope of considerations that must be addressed and the kinds and numbers of stakeholders that are typically involved at the systems level. System-level stakeholders usually include different kinds of engineers who have different technical specialties and different ways of thinking about systems that include electrical, mechanical, civil, and other kinds of components.

Another important consideration is that software engineers who participate in systems engineering activities at a given competency level should have the same or higher level of competency in the corresponding software engineering activity. For example, a software engineer who participates as a Practitioner in systems requirement elicitation should be a competent software engineering Practitioner for the activity of software requirements elicitation. Similarly, a Team Leader for requirements engineering at the systems level should be a competent Team Leader for requirements engineering at the software level.

Although the activities in Table A are listed in a sequential order, they are often accomplished in iterative and incremental steps. Table B includes the activities, at five different competency levels, for each skill in this skill area.

Table A17				
Software Systems Engineering Skill Sets	Software Systems Engineering Activities			
System Development Life Cycle Modeling	 Select and integrate a software engineering development model into a systems engineering development model. Tailor policies, procedures, and templates and select applicable standards. 			
Concept Definition	 Identify system stakeholders. Develop the operational concepts (system context, operational environment(s), prioritized features, quality attributes, operational scenarios, assumptions, dependencies, limitations, and exclusions). 			

Table A17	Table A17				
Software Systems Engineering Skill Sets	Software Systems Engineering Activities				
System Requirements Engineering	 Establish the system development environment and identify technology constraints. Identify system-level traceability requirements and tools. Identify system requirements. Develop the system requirements specification. Develop plans, procedures, and scenarios for system integration, verification, validation, and deployment. 				
System Design	 Develop alternative solution concepts. Identify system components and specify relationships and interfaces among components. Conduct trade studies to identify major system components for hardware/software/ manual operations. Participate in making acquisition decisions for system components. Influence system design to avoid isolated stovepipe units of software. 				
Requirements Allocation	 Allocate requirements and interfaces to system components (functional, behavioral, structural, quality) and interfaces between software components and other major system components. Develop bi-directional traceability between system requirements and software requirements. Analyze, clarify, and refine requirements allocated to software. 				
Component Engineering	 Determine needed kinds of software components (database, algorithms, internet protocols). Make acquisition decisions for software components (buy, build, open source, and so forth). Work with software engineers who develop and integrate software components. Provide liaison from software engineering to systems engineering and other major component engineering. 				

Table A17				
Software Systems Engineering Skill Sets	Software Systems Engineering Activities			
System Integration and Verification	 Integrate software with other system components. Participate in system verification activities. Provide liaison to software component engineers. 			
System Validation and Deployment	 Participate in simulated and live system tests. Participate in system acceptance testing. Provide liaison to software component engineers. 			
System Sustainment Planning	 Participate in planning for system sustainment. Prepare for operational support. Provide liaison and participate in planning for software sustainment. 			

The following notations are used in Table B17: Follow (F), Assist (A), Perform (P), Lead (L), Create (C).

System Sustainment Planning		1. Assists in planning for system sus- tainment. (A)	1. Participates in identify- ing stake- holders and developing a transition plan and require- ments for operational support. (P)	1. Establishes criteria and procedures for system sustain- ment.			
System Susta			2. Prepares for opera- tional sup- port. (P)	2. Leads/ participates in planning for system sustain- ment. (L)			

18. SOFTWARE QUALITY SKILL AREA

The software quality skill area consists of fundamental skills that a software engineer needs to possess in order to produce a highquality product, which is defined as one that conforms to its requirements and satisfies user needs. In SWECOM, the software quality skill area includes both software quality assurance and software quality control, which includes verification and validation. Measurement plays a major role in the areas of software quality assurance and control. In this skill area, we only discuss the data collection and data analysis portion of measurement as an activity in a specific skill topic. A complete treatment of measurement is covered in the software measurement skill area.

Software Quality Assurance (SQA) includes all competencies associated with ensuring a quality process. In other words, SQA within an organization establishes a series of processes, methods, standards, and techniques that are used throughout the organization to develop high-quality products. SQA is also responsible for implementing monitoring techniques to assure that established processes, methods, standards, and techniques are followed. Finally, SQA is responsible for implementing appropriate feedback loops that prevent defects from being introduced into the product. Collecting information and conducting root cause analyses continually improves the organization's ability to produce high-quality software products in the future.

NOTE: For the purposes of this document, its treatment of SQA is not comprehensive because some SQA processes are covered in other skill areas (for example, code source control in the

construction skill area) or as other skill areas (for example, configuration management).

Software Quality Control (SQC) includes all competencies associated with ensuring a quality product. In other words, an organization ensures that the software product will meet its quality goals through SQC. Software quality control may also be referred to as Software Validation and Verification; there are, however, some minor differences between the two terms.

Software Verification and Validation consists of fundamental competencies that a software engineer should possess in order to produce a high-quality product. Some of these competencies are needed throughout the software development life cycle (for example, reviews) and some are more specific to a specific phase of the project (for example, testing, which is covered in the software testing skill area).

Within software industries, some of the above terminologies have been used interchangeably. The purpose of this competency model is not to debate the proper use of these terminologies but to identify some of the major skills and corresponding activities that are required of software engineers in order to deliver high-quality products. Table A presents the skill areas and corresponding activities performed within those skill areas. Table B presents competency levels for the activities. It is important to note that, in this document, some of the activities associated with a specific skill may belong to either SQA or SQC.

Table A18	
Software Quality Skill Sets	Software Quality Activities
Software Quality Management (SQM)	 Instill a culture of producing high-quality products. Establish and follow quality goals and quality attributes. Establish and follow a quality plan. Identify, establish, follow, and verify appropriate processes, standards, and quality models that facilitate achieving quality goals and attributes. Identify stakeholders that have authority and/ or accountability for the process and product quality. Identify and use appropriate tools and measurements needed to reach quality goals and attributes. Establish and execute corrective actions if quality goals are not achieved. Establish and execute appropriate continuous improvement processes. Establish and update requirement traceability metrics and verification metrics.
Reviews (review, walkthrough, inspection)	 Plan, organize, and conduct appropriate review meetings. Participate as a member of the review team. Collect and analyze appropriate data resulting from the review. Identify, assign, and perform necessary corrective actions.
Audits (concentrate on both product and process, but are done by an independent, internal or external, organization)	 Plan, organize, and conduct independent audits. Collect appropriate data resulting from the audit. Collect and analyze data collected from the audits. Establish and implement appropriate resolutions for identified problems.
Statistical Control	 Identify and collect a set of quality data under statistical control. Identify a set of subjective and objective variances for the data. Analyze collected data. Establish and implement a set of control processes. Evaluate the effectiveness of the control processes.

The following notations are used in Table B18: Follow (F), Assist (A), Perform (P), Lead (L), Create (C).

Table B18							
Software Quality Skill Sets and Activities by Competency Level							
	Levels						
Skill Sets	Technician	Entry Level	Practitioner	Technical Leader	Senior Software Engineer		
Software Quality Management (SQM)	1. Follows defined quality pro- cesses and standards. (P)	1. Follows quality standards for the product and supporting processes. (P)	1. Establishes quality standards for the product. (P/L)	1. Establishes a culture of produc- ing quality products and of fol- lowing quality processes across proj- ects. (P/L)	1. Creates new and improved quality practices for deliver- ing high- quality products. (C)		
	2. Assists with estab- lishing the appropriate infrastruc- ture (such as defect tracking tools) to support organiza- tions' qual- ity goals. (A)	2. Follows defined quality models. (P)	2. Selects appropri- ate SQM processes that support the identi- fied quality goals for the project. (P)		2. Creates new pro- cesses. (C)		
So		3. Uses appropriate tools and resources to develop quality products. (P)	3. Identifies quality character- istics and attributes for the product and establishes priorities. (P)	2. Establishes quality standards, models, and processes for projects. (P/L)	3. Examines and assesses the effec- tiveness of a specific SQM pro- cess across an organi- zation. (C)		

Table	Table B18							
Softwa	Software Quality Skill Sets and Activities by Competency Level							
Skill Sets	Technician	Entry Level	Levels Practitioner	Technical Leader	Senior Software Engineer			
Software Quality Management (SQM)		4. Assists with iden- tification of the differ- ent quality character- istics and attributes for the product. (A/P)	4. Identifies the quality models that need to be followed for the project. (P)	3. Analyzes the advan- tages and disadvan- tages of alterna- tive SQM processes and tools that can be used for achieving organiza- tional goals for product quality. (P)	4. Makes recom- mendations related to organiza- tion-wide SQM pro- cesses. (C)			
		5. Ensures that prod- uct-quality goals are achieved. (P)	5. Develops the Quality Assurance (QA) plan for the proj- ect. (P)	4. Develops the QA plan for the proj- ect. (L)	5. Creates/ modifies SQM pro- cesses to achieve higher-qual- ity products and pro- cesses. (C)			
		6. Collects quality met- rics and prepares quality documenta- tion to be shared with appropriate stakehold- ers. (P)	6. Identifies appropri- ate stake- holders who have author- ity and account- ability regarding the qual- ity process and quality product. (P)	5. Identifies organiza- tional mea- sures that support achieving product- quality goals (across projects). (P/L)	6. Proposes/ Designs new tools to improve the achieve- ment of product- quality goals. (L)			

Software Quality Skill Sets and Activities by Competency Level							
	Levels						
Skill Sets	Technician	Entry Level	Practitioner	Technical Leader	Senior Software Engineer		
Software Quality Management (SQM)		7. Develops and updates an appro- priate traceability matrix for the product. (P)	7. Identifies appropriate measures that support achieving product- quality goals. (P/L)	6. Identifies continuous improve- ment opportuni- ties across projects. (L)			
			8. Identifies appropriate tools and resources that need to be used in order to achieve product- quality goals. (P/L)				
			9. Verifies that quality goals and require- ments are met. (P/L)				
			10. Identifies continuous improve- ment opportuni- ties across the project. (L)

19. SOFTWARE SECURITY SKILL AREA

Software security is a crosscutting skill area that affects the entire software development and operation life cycle. It includes techniques and processes to identify potential security vulnerabilities, avoid such vulnerabilities in design and implementation, and discover them in software artifacts. It includes mimicking an attacker and reviewing attack patterns. It also includes collecting and monitoring metrics to ensure that disciplined software development processes are followed. Testing is included in a separate skill area.

Qu		2. Uses static analy- sis methods to identify security vulnerabili- ties. (P)			

20. SOFTWARE SAFETY SKILL AREA

The quality of safety-critical systems (systems in which human life, health, property, or the environment is at risk) is essential. Modern system safety is based on analysis of system functionality and identification of hazards, risks, and acceptance criteria. Such analysis and identification result in specific safety requirements that need to be considered in order to guide subsequent design and implementation.

The safety process must be comprehensive, with structured objectives that require rigorous engineering evidence to verify safety functionality, which must be deterministic and result in a system with acceptable risk for its intended operating environment. Development of safety-critical systems must address functional hazard analyses and include detailed specification, design, and implementation artifacts at all levels.

Supervises collection of QM data and their compatibil- ity with the safety case. (P/L)	1. Manages the over- all project quality with a focus on safety aspects. (L)	1. Contributes expertise to improve means of measuring and estab- lishing the safety qual- ity of the product and process. (C)

21. SOFTWARE CONFIGURATION MANAGEMENT SKILL AREA

According to IEEE Standard 828-2012, configuration management is the discipline of applying technical and administrative direction and surveillance to identify and document the functional and physical characteristics of a configuration item, to control changes to those characteristics, to record and report change processing and implementation status, and to verify compliance with specified requirements [IEEE 828-2012]. According to the Software Configuration Management KA in the *SWEBOK Guide* [SWEBOK 2014], the elements of software configuration management include:

- Software configuration identification
- Software configuration control
- Software configuration status accounting
- Software configuration auditing
- Software release management and delivery

Skills for each of these elements and the associated activities are indicated in Table A21. The following acronyms are used in Table A21 and throughout this skill area:

- SCM: Software Configuration Management
- SCMP: Software Configuration Management Plan
- SCI: Software Configuration Item
- SDLC: Software Development Life Cycle

22. SOFTWARE MEASUREMENT SKILL AREA

Measurement is foundational to the engineering disciplines, including software engineering. Measurements are used to quantify attributes of processes and products for the purposes of assessing progress and providing indications of real or impending problems. Measurement is a crosscutting skill area that applies to each of the other skill areas in this competency model. To be effective, measurement activities are planned prior to implementation and adjusted as necessary during implementation to improve effectiveness.

Planning at the project level includes identifying measurement needs, selecting measures and measurement scales, establishing data collection and analysis methods, setting target values and thresholds, and other planning activities, which are listed in Table A22. Measurement planning skills at the organizational level are also included. Plans are then implemented to perform measurement activities. Planning and performing measurement includes the activities listed in Table B22.

The skills and activities in this skill area apply equally to measurement of management attributes, such as schedule and budget. The emphasis of this skill area, however, is on measurement of process and product attributes. Process attributes to be measured may include items such as the percent of effort for various work activities, levels of rework for various work products, and so forth. Product measures may include items such as work products completed, rate of defect discovery and defect correction, and so forth. See the cited references for more information on process and product measures and measurement.

23. HUMAN-COMPUTER INTERACTION SKILL AREA

Design of human-computer interaction (HCI) and of user interfaces has been traditionally regarded as part computer science and part human factors. Software engineers have, by necessity, become increasingly involved in the development cycle of HCI analysis, design, implementation, evaluation, and deployment because the user interface is often the difference between a successful product and a product that is either difficult to use or not used at all. To the user, the interface is the system.

This skill area covers skills and activities specific to the development of HCIs. There is, however, a great deal of similarity to other skill areas. For example, requirements elicitation for HCIs has much in common with conventional elicitation but there are some requirements-gathering skills that are particular to the development of human-computer interfaces. Some activities are unique to HCI, for example, the activities of interaction style design.

Table A23	
Human-Computer Interaction Skill Sets	Human-Computer Interaction Activities
Requirements	 Identify stakeholders who provide HCI requirements. Determine a process model for HCI development. Select HCI-related tools. Identify target users and their attributes. Develop user interface requirements. Identify constraints on user interface implementation. Prototype to elicit requirements. Specify applicable standards. Identify interface requirements between the user interface and system components.
Interaction Style Design	 Identify metaphors and conceptual models. Identify interaction mode(s). Document primary and exception use case scenarios. Develop interaction dialogs. Develop models and prototypes for interaction flow. Design input error handling. Establish two-way traceability to user interface requirements, test scenarios, and test cases. Refine existing and develop new prototypes. Design technical interfaces between the user interface and other system components.
Visual Design	 Design page/screen layout. Select icons. Design menus. Select color theme, font styles, and sizes. Develop mock-ups and sketches of screens.
Usability Testing and Evaluation	 Test user interface with a usability checklist. Conduct heuristic or expert evaluations. Identify and obtain representative test subjects. Design usability tests. Conduct usability tests with users. Analyze and report the results of usability testing.
Accessibility	 Determine accessibility needs of special needs users (such as color-blindness, physical disabilities, hearing or vision loss). Test for special-needs user accessibility. Utilize tools and techniques to provide accessible interface elements.

The following notations are used in Table B23: Follow (F), Assist (A), Perform (P), Lead (L), Create (C).

	Levels						
Skill Sets	Technician	Entry Level	Practitioner	Technical Leader	Senior Software Engineer		
		3. Assists in identify- ing user interface require- ments. (A)	5. Leads identifica- tion of user interface require- ments. (L)	4. Leads review and refinement of user interface require- ments. (L)			
nents	2. Follows directions to create simple pro- totypes for use in elic- iting user interface require- ments. (F)	4. Designs and creates prototypes for use in elicit- ing user interface require- ments. (P)	6. Reviews and refines prototypes, tests for elicita- tion, and refines user interface require- ments. (P)		3. Modifies existing and creates new methods and tools for proto- typing. (C)		
Requirements			7. Uses prototypes to elicit and refine user interface require- ments. (P)				
			8. Identifies technical interface require- ments (between the user interface and system compo- nents). (P)	5. Identifies constraints on user interface implemen- tation. (L)			

Human-Computer Interaction Skill Sets and Activities by Competency Level

	Levels					
Skill Sets	Technician	Entry Level	Practitioner	Technical Leader	Senior Software Engineer	
Requirements			9. Designs the details of the technical interface require- ments (between the user interface and system compo- nents). (P)	6. Defines the techni- cal interface require- ments (between the user interface and system compo- nents). (L)	4. Modifies existing and creates new methods and tools for specify- ing techni- cal interface require- ments. (C)	
				7. Selects applicable standards. (L)		
Interaction Style Design	1. Follows instruction to assist in docu- menting use cases, scenarios, interaction dialogs, and story- boards. (F)	1. Documents use cases, scenarios, interaction dialogs, and story- boards. (P)	1. Reviews and refines use cases, scenarios, interaction dialogs, and story- boards. (L)	1. Leads and coor- dinates interaction- style design activities. (L)	1. Modifies existing and creates new methods and tools for interac- tion-style design. (C)	
	2. Assists in identifying user input errors. (A)	2. Assists in identify- ing user input errors and error handling approaches. (A)	2. Identifies user input errors and error handling approaches. (P)	2. Selects and refines user error handling approaches. (P)		

Table B23							
Human-Computer Interaction Skill Sets and Activities by Competency Level							
	Levels						
Skill Sets	Technician	Entry Level	Practitioner	Technical Leader	Senior Software Engineer		
Interaction Style Design		3. Assists in identifying interaction modes. (A)	3. Applies metaphors and concep- tual models to define interaction style. (P)	3. Selects metaphors and concep- tual models. (L)			
			4. Identifies and refines interaction modes. (P)	4. Works with the system design team to establish component interfaces between the user interface and system compo- nents. (L)	2. Modifies existing and creates new methods and tools for interac- tion-style design. (C)		
	3. Documents two-way traceability to require- ments and to test cases and test scenar- ios. (P)	4. Establishes two-way traceability between use cases, scenarios, interaction dialogs, and storyboards and spe- cific user interface require- ments and acceptance criteria. (P)					

Table B23								
Human-Computer Interaction Skill Sets and Activities by Competency Level								
	Levels							
Skill Sets	Technician	Entry Level	Practitioner	Technical Leader	Senior Software Engineer			
Interaction Style Design	 4. Follows directions to develop or refine interface prototypes. (F) 	5. Develops interface prototypes. (P)	5. Reviews and refines interface prototypes. (P)					
Visual Design		1. Assists in designing page/screen layout. (A)	1. Designs page/screen layout. (P)	1. Revises/ approves final page/ screen lay- outs. (L)	1. Modifies existing and creates new methods and tools for visual design. (C)			
		2. Assists in selecting from exist- ing icons and design- ing new icons. (A)	2. Selects from exist- ing icons and designs new icons. (P)	2. Revises/ approves icons and identifies new icons as needed. (L)				
		3. Assists in select- ing color theme, font styles, and font sizes. (A)	3. Selects color theme, font styles, and font sizes. (P)	3. Revises/ approves color theme, font styles, and font sizes. (L)				
		4. Assists in menu design. (A)	4. Designs menus. (P)	4. Reviews and refines menu designs. (L)				

Table B23

		1. Assists in identifying accessibility needs for user inter- faces. (A)	1. Identifies accessibility needs for user inter- faces. (P)	1. Leads and coor- dinates accessibility activities. (L)	1. Develops new tools and tech- niques for providing accessible interface elements. (C)			
lity			2. Develops acceptance criteria and tests for accessibil- ity aspects of the user interface. (P)	2. Determines which accessibil- ity needs must be addressed in the user interface. (L)				
Accessibility		2. Assists in identifying the needs for inter- national accessibility (languages, cultural consider- ations, and so forth). (A)	3. Identifies the needs for inter- national accessibility (languages, cultural consider- ations, and so forth). (P)	3. Determines the extent to which the user inter- face must accommo- date needs for inter- national accessibil- ity. (L)				
		3. Uses the selected tools and techniques for imple- menting required accessibil- ity. (A)	4. Selects tools and techniques for provid- ing required accessibil- ity. (P)					

24. APPENDIX A: CONTRIBUTORS

SWECOM Team Members

Mark Ardis, Stevens Institute of Technology
Dick Fairley, Software and Systems Engineering Associates (S2EA), Team Leader
Thomas Hilburn, Embry Riddle University
Ken Nidiffer, Software Engineering Institute
Massood Towhidnejad, Embry Riddle University
Mary Jane Willshire, Software and Systems Engineering Associates (S2EA)
Kate Guillemette, IEEE Computer Society

Interviewees

Elias Abughazaleh, Quality Assurance Director, Symantec Corporation
Laura Jordan, Technical Support Manager, Symantec Corporation
Matthew Larson, Software Development Manager, Symantec Corporation
Stephen Link, Chief Systems Engineer, Harris Corporation
Kim Madler, Software Development Director, Symantec Corporation

Thomas Schabowsky, System Engineer and Architect, Harris Corporation

25. APPENDIX B: SWECOM INTENDED AUDIENCES

The intended audiences for this software engineering competency model (SWECOM) include individual software and systems engineering practitioners, their managers, and workforce planners. Others who may also find these models useful are indicated.

- Software engineering and systems engineering practitioners will use SWECOM for self-evaluation, self-improvement, and career planning. In addition, practitioners can use a competency model to provide guidance in selecting academic programs and training classes. SWECOM can also provide a framework for discussions with leaders and supervisors.
- Managers of practitioners will use SWECOM to select skills at various skill levels and group them into job roles and job descriptions, to establish performance criteria, to establish an objective basis for performance evaluations and development of career paths for individual practitioners, and to perform gap analysis.
- Work force planners will use SWECOM to develop skills inventories and perform gap analysis, to prepare workforce development plans, to define career ladders, and to select and hire employees, contract personnel, and contractor organizations.
- Curriculum designers and other software engineering education researchers will use SWECOM to design competencybased education and training curricula.

Others who may find SWECOM useful include

- IEEE Computer Society: for standards preparation, services to industry (training and consulting), curriculum development, assistance to schools and industry for development and assessment of professional development programs, and as a source of authoritative credentials and credibility in the computing professions.
- Other professional societies: to determine common interests, overlaps, and boundaries.
- Legislative and legal bodies: to provide guidance for licensing criteria.
- *Regulatory agencies*: to provide guidance in establishing regulations that impact the health, safety, and welfare of the general population.
- *Others*: to find novel uses for SEWCOM not envisioned by the developers.
- *Society at large*: to use as a model for increasing the number of competent software and systems engineering professionals.

26. APPENDIX C: SWECOM USE CASES

USE CASE #1:

Organization Using SWECOM to Create a New Hire Job Description and Screen Job Candidates

Goal: An organization will use SWECOM to create a job description and hire personnel.

Actors: A hiring manager and human resource personnel

Preconditions and Assumptions:

- 1. There is a need to hire additional personnel with specific competencies.
- 2. The organization has access to SWECOM and the Staffing Gap Analysis worksheet.

Trigger: There is a need to hire additional personnel with specific competencies.

Normal Flow:

- 1. A manager has identified a need for additional personnel.
- 2. The manager uses SWECOM and the Staffing Gap Analysis worksheet to identify the needed skills.
- 3. The manager, in collaboration with human resource personnel, develops a job description to be posted.

- 4. Human resource personnel conduct an initial screening of applicants, using the job description and competency model as a guide.
- 5. The manager and/or human resource personnel use SWE-COM to choose the best candidate who meets the needs of the organization.

Post Conditions:

- 1. The organization has identified the needed skills.
- 2. The organization has hired an employee who best matches the needed skills.

USE CASE #2: Employee Using SWECOM for Self-Improvement

Goal: An employee will use SWECOM to evaluate his or her software systems engineering competencies for the purposes of selfevaluation and improvement.

Actor: A software engineer working in a software industry.

Preconditions and Assumptions:

- 1. The employee has identified an interest in software systems engineering.
- 2. The employee has access to SWECOM and the Individual Gap Analysis worksheet.

Trigger: The employee wants to conduct a self-evaluation of his or her own capabilities in software systems engineering and/or is interested in improving his or her capabilities in software systems engineering in order to reach a higher level of competency.

Normal Flow:

- 1. The employee has identified the software systems engineering skills he or she is interested in to conduct self-evaluation.
- 2. The employee conducts a self-evaluation against each activity in the skills of interest.

- 3. The employee identifies his or her current competencies.
- 4. The employee uses the Individual Gap Analysis Worksheet to document his or her competencies for the selected skills.

Post Conditions:

- 1. The employee has a good understanding of his or her current competency levels.
- 2. The employee has a good understanding of activities to be improved to reach the desired competency levels for those activities.

USE CASE #3:

Manager Using SWECOM for Evaluation and Improvement Planning for Team Member

Goal: A technical manager will use SWECOM and the Staffing Gap Analysis worksheet to evaluate a member of his or her team and/ or develop an improvement plan for the team member.

Actor: A technical manager

Preconditions and Assumptions:

- 1. The team member to be evaluated or guided has been identified.
- 2. The team member's areas of expertise or his or her roles and responsibilities in the team have been identified.
- 3. The manager has access to and familiarity with SWECOM and the Staffing Gap Analysis worksheet.

Trigger: The manager has identified the need to assess the team member's competencies and/or develop an improvement plan to guide him or her in advancement.

Normal Flow:

- 1. The manager has identified skill areas that apply to the team member's present and future roles and responsibilities.
- 2. The result of the gap analysis will be used as part of the team member's evaluation and preparation of an improvement plan.

Post Conditions:

- 1. The manager has completed the evaluation of the team member.
- 2. The manager and team member have met to discuss the manager's evaluation of the team member's present competencies and competencies needed in the future.
- 3. The team member has a good understanding of what he or she needs to improve in order to eliminate the existing gap between his or her present competencies and desired competencies.

USE CASE #4: Curriculum Designer Using SWECOM to Prepare a Competency-Based Curriculum

Goal: A curriculum designer will use SWECOM to prepare an academic or training curriculum for one or more of the SWECOM skills or skill areas to achieve the desired level of competency for each skill or skill area.

Primary Actor: A curriculum designer

Secondary Actor: A sponsoring academic or industrial organization

Preconditions and Assumptions:

- 1. The skill area (or areas) and the level (or levels) of competency to be achieved have been identified.
- 2. The curriculum designer has access to and familiarity with SWE-COM and the Staffing or Individual Gap Analysis worksheet.

Trigger: An academic or industrial organization has identified the need to improve the identified competencies of students or employees and has commissioned a curriculum designer to prepare a competency-based curriculum for one or more skills or skill areas at a stated level (or levels) of competency to be achieved.

Normal Flow:

- 1. The curriculum designer conducts a gap analysis to determine the skills that candidate students or employees currently have, the learning outcomes to be achieved and demonstrated, and the gap to be closed by education and/or training.
- 2. The curriculum designer prepares the curriculum, including topics to be covered, reference materials, facilities needed, and the learning outcomes to be demonstrated.
- 3. The curriculum designer presents the curriculum to the academic or industrial organization and makes requested changes.

Post Conditions:

- 1. The curriculum designer has completed preparation of the desired curriculum.
- 2. The academic or industrial organization has reviewed and approved the curriculum, perhaps after requested revisions are made by the curriculum designer.
- 3. The resultant curriculum is suitable as a basis for designing courses, preparing materials, and acquiring necessary facilities and resources.

27. APPENDIX D: GAP ANALYSIS WORKSHEETS

Staffing Gap Analysis Worksheet			
Date Completed: [xxx]			
Organizational Unit: [xxx]
